Goodness of Fit

Discrete Dat Distribution Fitting

#### Lecture Overview

#### Distribution fitting

• Finding the best-fitting theoretical probability distribution for the observed data

Three approaches covered in this lecture:

MASS: fitdistr()

• fitdistrplus: fitdist()

• gamlss: fitDist()

#### Notes:

- No need to specify distribution function for the last approach, i.e., fitDist()
- Introduction and overview to a very broad field of research

Distributions

Goodness o

Discrete Date Distribution Fitting

#### Introduction

Empirical work often requires understanding of the underlying distribution of data:

- Distribution of corn yields in a particular county based on observations to calculate the probability of getting a yield below a certain threshold, e.g., for crop insurance purposes
- Wind speed distribution at a particular location for construction of a wind farm:
   Electricity production is not possible below and above a certain wind speed

Estimation of one or more parameters characterizing a probability distribution function

#### Weibull: Random Data Generation

Random generation of data (N=10000) following a Weibull distribution with two parameters:

Shape: k = 2
 Scale: λ = 1.5

weibulldata = rweibull(10000,2,1.5)

Discrete Date Distribution Fitting

### Distribution Fitting Steps

General steps (see Fitting Distributions with R by Vito Ricci for more information)

- **1** General hypothesis about candidate distributions, e.g., discrete vs. continuous, entire real number line vs. positive numbers only
  - Histogram as a valuable first approach
- 2 Parameter estimation
  - Example: Calculating shape and scale parameters of the Weibull distribution or mean and variance for a Normal distribution
- Goodness of fit

#### Meridian Hills: Possible Distributions

#### Meridian Hills home values:

- Source: https://jrfdumortier.github.io/dataanalysis/
- 101 home values in the Meridian Hills neighborhood in Indianapolis
- Scaling of data to measure home values in \$1000

#### Candidate distributions:

- Gamma distribution: Shape and scale parameter
- Weibull distribution: Shape and scale parameter
- Log-normal distribution, i.e, Y = ln(X) has a normal distribution:  $\mu$  and  $\sigma$

```
mhprice = mh1$price/1000
mhgamma = fitdistr(mhprice, "gamma")
mhweibull = fitdistr(mhprice, "weibull", lower=c(0,0))
mhlognormal = fitdistr(mhprice, "log-normal")
```
